

To holders of the preliminary design DVD's made available February 2009,

In February 2009, a set of DVDs containing preliminary design information for I-15 CORE was made available to interested parties. The files provided in February were a status set of the on-going preliminary design effort. As such, some files and data that were considered to be undergoing a significant amount of change at that time were intentionally omitted from the February DVDs. Accordingly, only a sample set of InRoads templates (.ird files) was provided on the February DVDs. The InRoads .rwks and .itl files were intentionally not provided.

An interim design release will occur in late April 2009 that will include the following additional and updated files:

- Proposed surface Digital Terrain Models (DTM)
- InRoads horizontal and vertical alignment files
- Typical sections (I-15 mainline)
- Proposed ROW line work
- Proposed cross-sections
- Draft Geotechnical Report

Our intent is to provide the design-build teams with the most complete information available, while managing anticipated revisions to that information. The design files to be provided in the late April interim release will again be a "snap shot in time" of the on-going design work. The information will be preliminary and subject to change. A subsequent update to the design files will be provided with the issuance of the Draft RFP.

Thank you for your interest in this important project.
